### Search help

#### Exact match supported for author search results

You can perform an exact author search by enclosing the name (first and/or last) of the author in quotation marks.

#### Boolean operators

The Boolean operators AND, OR, and NOT can be applied to search terms.

#### AND (also + or &)

Use AND to search for documents containing two or more terms. For example, the following query returns documents containing both cat and dog:

cat AND dog

The AND operator is applied by default; for example cat AND dog produces the same results as cat dog.

#### OR

Use OR to search for documents containing at least one of two or more terms. For example, the following query returns documents containing cat, documents containing dog, and documents containing cat and dog:

cat OR dog

#### NOT

Use NOT to search for documents that do not contain a given term. For example, the following query returns documents containing cat but not containing dog:

cat NOT dog

### 1 ABSTRACT

Despite significant renewable energy expansion in the past, Germany has encountered difficulties in meeting its national greenhouse gas emission targets. In response, Germany adopted the Federal Climate Change Act (CCA) in 2019. We analyze the state of climate governance in Germany before the CCA, the main design elements of the CCA, and assess the potential of the CCA to change German climate governance. Drawing on policy integration theory and 26 semi-structured interviews with senior policymakers and stakeholders, we find that German climate governance before the CCA was only moderately integrated. The sectoral emission targets legislated by the CCA make climate change mitigation a priority sector goal in non-energy sectors, and CCA provisions for monitoring, assessing and implementing policy reforms promise to enhance alignment of instruments with targets over time. Overall, the CCA advances a multi- rather than cross-sector climate governance, failing to advance coordination across sectors and ministries.

Quadrupedal animal, such as dogs, typically have soft but heavy abdomens, whose swinging motion significantly contribute to the energy efficiency of their entire locomotion. This study examines the effect of a swinging mass on quadrupedal locomotion by simulating the soft abdomen of its biological counterparts. A quadruped robot is designed with a swinging mass beneath its trunk. Its pitching motion was evaluated by a mechanical model. The experiment results demonstrate that the swinging mass effectively reduces the pitching motion, thereby improving the energy efficiency of the robot. Although the swinging mass does not always guarantee the energy efficiency of locomotion, the spring stiffness that supports the mass can be obtained for energy-efficient locomotion.
